

ABSTRACT

A plasma display panel capable of suppressing discharge error, releasing impurity gas from an inner space of the plasma display panel and filling discharge gas into the inner space of the plasma display panel
5 satisfactorily, thus improving brightness and image quality.

The plasma display panel including front panel (1) and rear panel (2) disposed opposing each other. Front panel (1) includes display electrode (6) composed of scan electrode (4) and sustain electrode (5) extending in a row direction. Rear panel (2) includes address electrode (10) extending in a column
10 direction and intersecting display electrode (6). A lattice form of barrier ribs (12) of row direction barrier ribs and column direction barrier ribs, which have the same height, forming a plurality of individually divided discharge cells is provided in a part in which display electrode (6) and address electrode (10) intersect each other. Row direction barrier ribs (12a) of barrier ribs (12) are
15 provided with communication portions (12c) communicating discharge cells in non-parallel to the column direction.
